Share my story

- Advocating for client /patient service improvements
- Advancing nursing role as a technology innovator
- Providing a legal nursing basis for developing activity sensing technologies
- Disseminating lessons learned to promote user adoption, engagement, and positive outcomes

Advocacy

1980 - Massachusetts first health center developed and licensed under the directorship of a Gerontological Nurse Practitioner, not an MD

LMH Senior Citizens Health Center

Designed as an extension of the hospital's ambulatory care program, the LMH Senior Citizens Health Center (SCHC) is a community-based facility that provides easy access to primary health care services for older adults. The center's services emphasize health education, health promotion and disease prevention, and include community educational programs, initial health assessments, podiatric services, counseling sessions, and access to complete diagnostic and treatment services offered at the Lawrence Memorial Hospital of Medical.

Mary Leveck	NINR

goal

To evaluate the effect of the **Reach for TLC** system on:
reducing caregiver stress related to the bothersome nature of managing the care recipients' disruptive behaviors

The 2am telephone message

Personalized by

- Tailored information
- Offering choices
- Response to personal goals
- Giving feedback

for TLC Telephone System

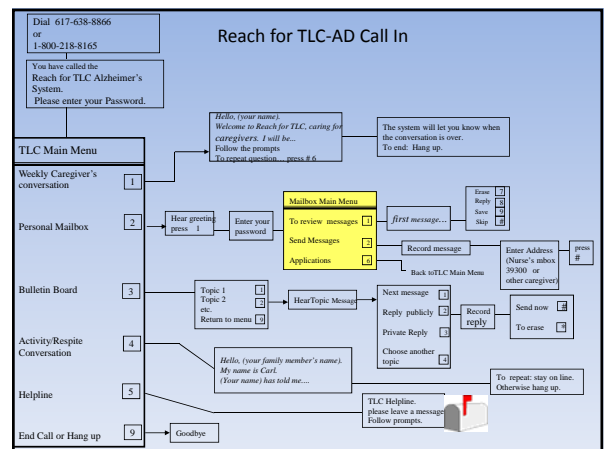

- Weekly caregiver IVR conversation (1-10 min)
- Personal Mailbox*
- Bulletin Board*
- CG Respite/ CR Distraction Activity conversation (18-40 min) *

*Available 24 hours a day

Mahoney, Tarlow, & Sandaire (1998) A Computer-Mediated Intervention for Alzheimer's Caregivers. Computers in Nursing, 16(4),208-216.

Mahoney, D. (1998). A content analysis of an Alzheimer family caregivers virtual focus group. *American Journal of Alzheimer's Disease*, Nov/Dec, 13(6),309-316. doi: 10.1177/1533317598013009006

Mahoney, D. (1999) Using a Website for Qualitative Research: Feasible or Foolish? Proc. 1999 American Medical Informatics Association AMIA symposium published proceedings (iii). PMID:1042232511

Study Sample

- 100 randomized caregiving dyads (n=200)
- 100 persons with an AD presumptive diagnosis
- 100 Primary AD family caregivers
- 80% female, 30% minority rate
- Intent-to treat analysis

Tarlow, B. & Mahoney, D. (2000) *The cost of recruiting AD caregivers for research. J of Aging & Health 11(4), 519-539.*

Nichols, L., Martindale-Adams, J., Burns, R., Coon, D., Ory, M., Mahoney, D., Tarlow, B., Burgio, B., Gallagher-Thompson, D., Guy, D., Arguelles, T. * Winter, L. (2004) Social marketing as a framework for recruitment: Illustrations from the Resources for Enhancing Alzheimer's Caregiver Health (REACH) study. *Journal of Aging and Health 16(5):1575-1765.* PMID 15448292

In Sum

- It worked!!

Effects of an automated support system on caregiver burden and anxiety: Findings from the REACH for TLC intervention study, D. Mahoney, B. Tarlow, & R Jones (2003) Gerontologist 43(4)556-567.

Gitlin, L. N., Belle, S. H., Burgio, L. D., Czaia, S. J., Mahoney, D., et al. (2003). "Effect of multicomponent interventions on caregiver burden and depression: The REACH multisite initiative at six month follow-up. *Psychology and Aging, 18, (3), 361-374.* PMID 14518800

Uniquely Reach for TLC

- Available anywhere there is a telephone
 - at home or while traveling / visiting
 - regular or cell phone
- 24 hours a day, 7 days a week
- Tailors to cgs needs + preferences
- Multiple intervention options
- Completely Automated Intervention
- Capacity for large scale use over long periods of time

Providers' Beliefs...&...Realities

- Technology is a-humanistic
- Human support is always preferred
- The more intensity of human support, 1 : 1 time, the better the outcomes (dose response)
- Aka: No referrals
- Many people dislike in-person groups or 1:1s
- **Low intensity, 24/7 multi-component technology that tailored support produced = effects with < dropouts**

Linking Home Care and the Workplace Through Innovative Wireless Sensor Technology

The Worker Interactive Networking (WIN) project.

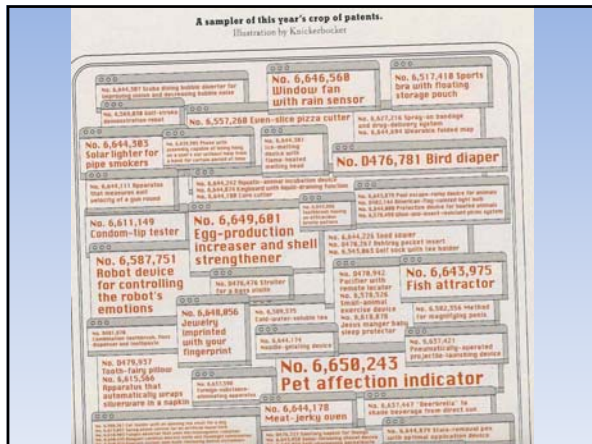

Funded by the Technology Opportunities Program, (TOP), NTIA, U.S. Dept of Commerce ('2001-04) D Mahoney, Principal Investigator

Main Research Question:

Could wireless sensor based technology be used in elders' homes and linked to the workplace to offer working caregivers a means to allay their concerns?

Process – Nursense©

- Nursing assessment
- Carers and Care Recipient's input

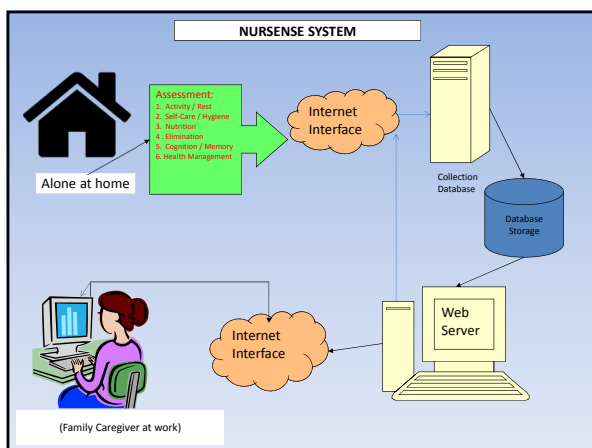

- Customizes Installation
- Tailors to specific concerns
- Consumers' choice drives the technology not vice versa

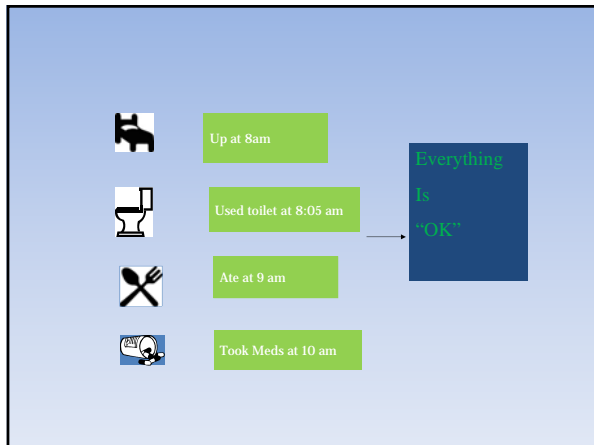

Mahoney, D. (2004) Linking Home Care and the Workplace Through Innovative Wireless Technology: The Worker Interactive Networking (WIN) project. *Home Health Care Management and Practice* 16(5),417-428.

Nursense©

- My definition: A systematic appraisal using the nursing process to tailor technology based applications to endusers' needs and wants
- A nursing action that engages endusers* to personalize and develop the optimal balance between in- person and automated sensing support

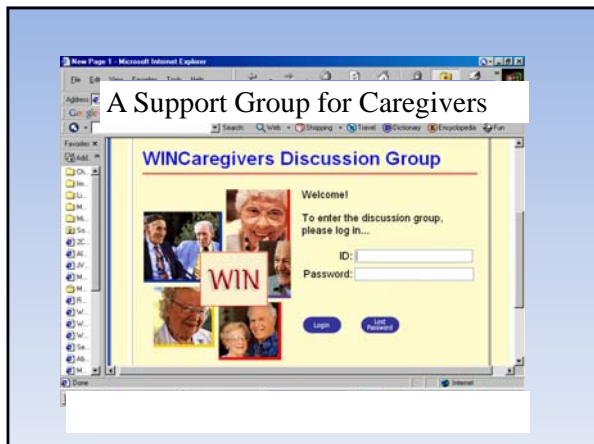

- Endusers*: Older adults; clients; patients; residents and/or formal/informal family caregivers, carers

Caregivers' Report

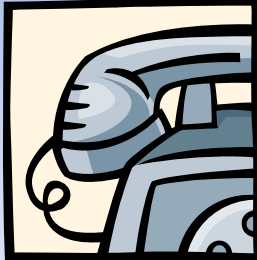

- Concern present; **Attention**
- Nearing level of concern, on **Watch**
- No concern, **OK**

Critics ---- Truth or Myths?

- Worker productivity will be reduced
- Personal contacts by family members will decline
- Tech will increase elders' social isolation
- It crosses the line for being intrusive
 - Who would want this technology in their home?
 - Big brother is watching in one's private space

No increased social isolation

- “What I do is call her several times a day. If she didn't answer, I would then check home monitoring. It didn't replace my calls...it was more of a backup”

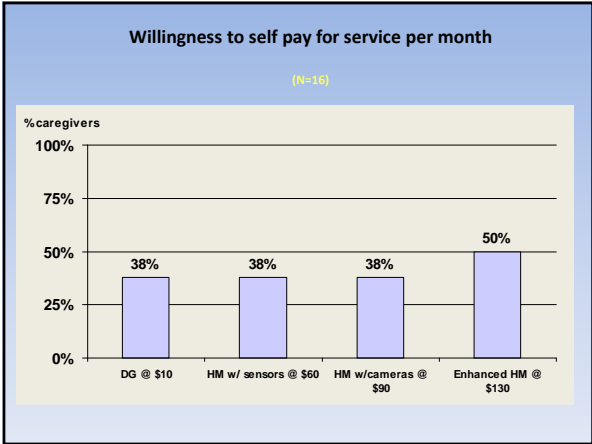

No Loss of Privacy

- All Elders Strongly disagreed that they felt
 - Their personal space was violated
 - “Big Brother” was watching
 - Embarrassed by the presence of equipment in home

No Intrusiveness

- All users strongly disagreed that:
 - Installation was a hassle
 - Installation caused damage to the house
 - Equipment got in the way at home
 - Equipment caused a change in daily routine
 - System maintenance visits were a nuisance

“Peace of Mind”

*I enjoyed it and it helps me at work. Even if someone used it occasionally, it is good to have it. There is nothing to lose. The information makes you feel more **at-ease**.*

it was wonderful to make sure my mother hadn't fallen down or had an accident. It keeps worry down, to track her movements from room to room, knowing she was getting around.

It is very easy to use. It is easy to install and you get help with that. It was worth the effort – you get more out of it than you need to put in.

It is a unique way to check in without altering their [family member's] trust. It give you **peace-of-mind**, definitely. It becomes like part of the furniture and is not a problem.

Great for peace of mind because it helps keep you informed of what is going on behind closed doors.

gives peace of mind. I don't think you need to monitor every move, but it is nice to have a checking system if something seems wrong.

It provides peace of mind as to your family member's condition and gives a hint of dangerous situations that may occur.

“At EASE” Purpose

- 1) to gain an understanding of the concerns in ILRs from the perspectives of the elders, families, building staff, and consulting NPs
- 2) to assess the feasibility of using X10 sensor technology in ILR
- 3) to determine if the concerns could be addressed through our wireless sensor based remote 24/7 monitoring system

Information Triaged

Methods & Samples

Qualitative

Phase 1

- Focus groups: 8, n=26
 - 5 Resident / family
 - 2 Building Staff
 - 1 NPs
- Content Analysis
 - Themes of concern
 - Across and within groups

Quantitative

- Phase 2. Technical X10 feasibility & reliability beta study n=2 units
- Phase 3. ZigBee system 4 mo intervention study n= 10 “sets” of endusers pre/post pilot outcomes

Phase 3 – Intervention Results

Pre-Post comparisons:

- Endusers reported increased:
 - “Peace of Mind” Security
 - Safety Satisfaction
- Elders reported no sense of intrusiveness or loss of privacy from this technology
- Emergency Alerts occurred for 6 cases over 12mo period.
 - No false positives

Theoretical Challenge

Research critics call for studies to **advance theoretical development and understanding about the multiple influences on older adults’ technology adoption**

- The high development cost of new technology interventions leads to predominantly small sample sizes that limit outcome analyses

Purpose

To develop an

Adoption of Gerontechnology Monitoring Model

to guide future implementation and outcome studies

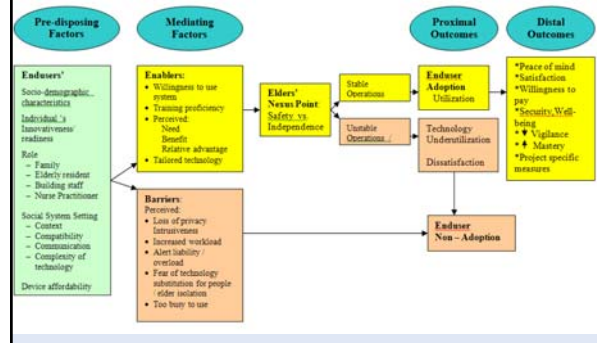

Publication: D.F. Mahoney (2011) An Evidence-based Adoption of Technology Model for Remote Monitoring of Elders’ Daily Activities. *Ageing International* 36(1)66-81

Method

- Data were re-analyzed guided by constructs from Roger’s Diffusion of Innovation Model and prior TAMs
 - Factors affecting the endusers’ acceptance and use of the monitoring technologies were the focus
- Model **components** arose as **major factors** in **two or more** of the contributing studies

Mahoney’s Adoption of Gerontechnology Model

Significance

- Family caregivers are the critical service provider for older adults with AD
- 85% of family caregivers help with ADL’s
- Dressing is the most common (61%) ADL**
 - Most pressing daily concern in early to mid-stage AD
 - > for adult children aiding parents
 - > for those of opposite gender
 - Yet relatively ignored by researchers

Mahoney, D., La Rose, S., & E. Mahoney(2015) Family caregivers’ perspectives on dementia related dressing difficulties at home: The Preservation of Self Model. *Dementia 14(4)494-512*; doi:10.1177/1471301213501821
 Mahoney, DF, Coon, DW, & Lozano, C. Latino/Hispanic Alzheimer’s Caregivers’ Experiencing Dementia Related Dressing Issues at Home: Corroboration of the Preservation of Self Model and Reactions to Using a “Smart Dresser” Computer-based Dressing Aid. *Digital Health 2016*, 1-10

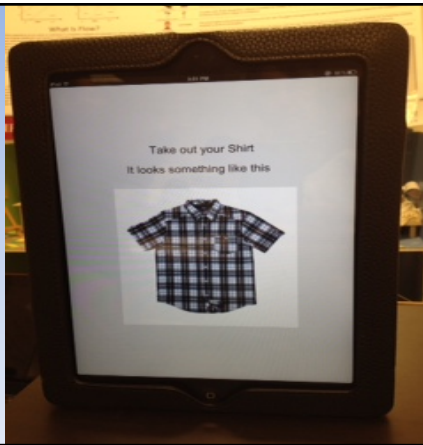

Caregiver Focus Group Findings

- Verified DRESS applicable late early to early mid-stage AD
- technology design not seen as “intrusive”, but **promoted dignity and independence**
- 90% of DRESS prototype features were affirmed
- **CG Recommendations:**
 - Change to dresser top “TV screen” aka iPad
 - Send alert if wandering out of the room occurs
 - Include option to use the CG’s voice for system prompts
 - Add chair and mirror to dress routine
 - Make interoperable with other monitoring devices

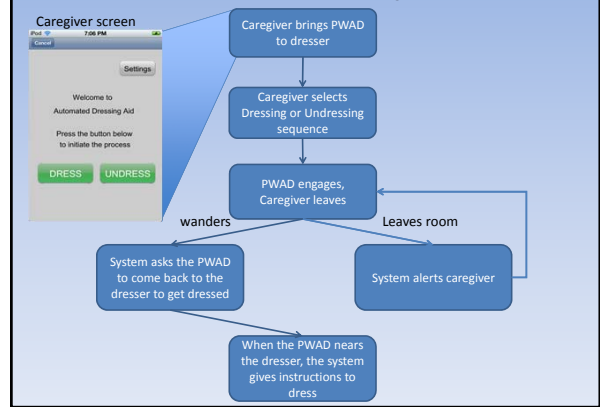

Interactive Dressing Coaching System

IPad
audio
prompting
visual cueing

Dress Wander Sequence

Prototype Validity and Reliability Testing

- 6 AD “actors”
 - simulated 9 dressing scenarios encompassing a variety of
 - Common dressing problems
 - Correct dressing responses
 - Randomly ordered
 - Outcome: Detection accuracy rate
1. DRESS overall correctly identified 78% of actions
 - Shirt related dressing +/- actions were consistent at 100%
 - Pants / inside out actions were most problematic
 2. Adjustment of Kinect thresholds improved overall rate to 100% with 4 new testers

www.ncbi.nlm.nih.gov/pubmed/26321895

Stability over time and Accuracy Testing

- Technical operations testing over a 110 day period
- The same 69 yr old male tested the system weekdays am and/or pm in a studio unit where the system’s hub was plugged in and DRESS operated 24/7 using the local Wi-Fi network. He alternated the role of the helper, using the caregivers’ device, or the PWD by putting on fiducial imbedded clothing, getting “stuck,” distracted, perseverating, and completing the task. He recorded usability issues in a diary
- In-person and remote system diagnostic checks were conducted to identify issues, validate the reliability of operations, confirm and annotate the system generated error log reports
- A content analysis was conducted on the event diary recordings and the annotated log reports. Quantitative analyses employed descriptive statistics to report the % of days with errors & types

In Sum: Advancing nursing innovation

- Risk taking can be energizing
- Rogue can be rewarding
- Apply your Nurse Sense
- Qualitatively know your clients' needs and wants
- Integrate evidence based design principles / models
- Plan to engage & sustain usage
