Student Poster Presentation

Does Remote Patient Monitoring Improve Health in Adults with Chronic Diseases in Outpatient Settings

Hosna Hadji Ebrahim Zargar, MSN Student

The technology that has an impact on the healthcare field is remote patient monitoring which is a category of Telehealth. Patients suffering from chronic diseases such as heart failure can benefit from Telehealth while they are at their own houses. Based on the evidence reviewed from five primary articles, the use of telehealth services has been shown to improve health in patients with chronic diseases. The purpose of this project was to analyze existing literature on the effects of remote patient monitoring in improving health in adults with chronic diseases in outpatient settings.
